

059 Relay Protection

Overview

The 59N function of the relay eliminates the need for grounding transformers and prevents the power system from injecting phase-to-ground faults. This avoids potential catastrophic damage to equipment and personnel in the plant, as well as possible loss of profit. This handbook covers the code of practice in protection circuitry including standard lead and device numbers, mode of connections at terminal strips, colour codes in multicore cables, dos and donts in execution. This technical file is intended solely for specially trained and. In North America protective relays are generally referred to by standard device numbers. Letters are sometimes added to specify the application (IEEE Standard C37. ANSI IEEE Standard Device Numbers are below: (the more commonly used ones are in bold) 86T is a Lockout Relay for a. In the design of electrical power systems, the ANSI Standard Device Numbers denote what features a protective device supports (such as a relay or circuit breaker).
