

Arc suppression coil relay protection

Overview

The devices that drive the coil are typically protected from this damage by placing a diode, MOV, or TVS suppressor across the coil. The suppressor can be embedded in the coil or installed externally in the electrical circuit or the electronic control system. In smart home panels, relays are subject to long-term and frequent operation, especially in scenarios involving AC input and load switching. Traditional MOVs (Metal Oxide). In this article I have explained the formula and techniques of configuring RC circuit networks for controlling the arcing across relay contacts while switching heavy inductive loads. With time, this condition can wear down. Arcing contacts have been the bane of industrial systems for as long as they have existed, but today systems run faster than ever before, so contact erosion becomes critical.

Prevent Relay Arcing using RC Snubber Circuits

Using Bidirectional TVS Diode Applying RC Snubber Parallel with The Switch Contact Using RC (Snubber) Suppression Parallel with The Load Ohm's law is applied to choose the most appropriate resistor value for the arc suppression. In the Ohm's law $R = V/I$, we apply the formula $R = 0.5 (V_{pk} / I_{SW})$ and $R = 0.3 (V_{pk} / I_{SW})$, where V_{pk} is the AC peak voltage (1.414 V_{rms}) and I_{SW} is the rated switching current of the relay contact). To decrease the contact degradation due to arcing, we have t... See more on homemade-circuits Elliott Sound Products
