

Can the fiber optic cable of a broadband connection be extended

Overview

Yes, fibre optic cables can be extended by using splice closures or optical connectors to join multiple cables together. This allows for longer distances to be covered without loss of signal quality. How do you extend your network?

If you get your hands on a Pre-terminated Fiber Optic Assembly and a couple of Media Converters, you're only a few steps away from. Fiber optical cable provides great advantages rather than copper cat5e/cat6 cable. Some extensions are simple and perfectly reasonable for a careful DIY job. Others are where people damage a good install trying to save time or avoid. But as reliable as these systems are, cables still need to be repaired or extended from time to time. Splicing allows you to restore or expand fiber networks while. In many applications, twisted pair connections are often remotely located and require extended lengths of cable — security cameras monitor outdoor locations, outbuildings connect to local area networks, remote rooms demand streaming media and gates require network connectivity.
