

How to split a single model in Columbia

Overview

To split a single molecule specify its id number. `split [molecule-id]` This allows moving individual chains and hiding individual chains using the Model Panel "active" and. The Model panel provides options that control how the model is to be built, for example, whether to use partitioning or split models, whether to transform numeric input fields so that they all fall within the same range, and how to manage cases of interest. For example, model #1 could be split into #1. The possible values for the input fields could have very different effects on. Adds command `split` for making chains of a molecule into separate molecules. `split`. Use the Split feature to create multiple parts from an existing part. To split a surface, the Trimming Surface must extend past the boundaries of the surface to split. Sometimes you may need to split a model into individual pieces so you can work with each part independently.

Claude Sonnet 4.6 vs Opus 4.6: 2026 Comparison,

Anthropic also changes the interaction model in 4.6 by pushing adaptive thinking and effort controls, which affects how both models spend

Command: split

For example, model #1 could be split into #1.1, #1.2, etc. Splitting parts of a model into separate submodels may facilitate their independent control, such as with Model Panel checkboxes or mouse

Building Split Models

Split modeling enables you to use a single stream to build separate models for each possible value of a flag, nominal, or continuous input field, with the resulting models all being accessible from a single

Split and Save Bodies

You can also save solid bodies after you split the model using the Save Bodies feature. This enables you to save the bodies from a split part to a different folder or with different names to the same folder.
