

Recommended Core Switch Scripts

AI Overview

For enterprise core switch management, recommended scripts include VLAN configuration, ACL deployment, firmware upgrades, rollback planning, and automation workflows using tools like GitHub labs or web-based switch managers.

Core Switch Script Recommendations

- 1. VLAN and Port Configuration Scripts** Scripts for creating, modifying, and migrating VLANs are essential for network segmentation and traffic management. These scripts typically include commands to:
 - Create VLANs and assign names
 - Map VLANs to specific ports or port channels
 - Migrate existing ports to new VLANs
 - Verify VLAN assignments and connectivity
- 2. ACL Deployment Scripts** Access Control Lists (ACLs) are critical for security and traffic filtering. Recommended scripts automate:
 - ACL creation and naming conventions
 - Applying ACLs to interfaces or VLANs
 - Testing and validating ACL rules
 - Rolling back ACL changes if needed
- 3. Firmware Upgrade and Rollback Scripts** Automating firmware upgrades reduces downtime and ensures consistency across switches. Scripts should:
 - Check current firmware versions
 - Upload and install new firmware images
 - Validate post-upgrade functionality
 - Provide rollback commands in case of failure
- 4. Automation and Workflow Management** Using tools like cc-switch-web, you can manage multiple switches, install skills, and run workflows across local or cloud environments. Recommended practices include:
 - Running scripts in headless or web server mode for remote access
 - Using Docker containers for consistent deployment
 - Automating repetitive tasks like provider switching or system prompt updates ()
- 5. Lab Simulation and Testing** Before deploying scripts in production, simulate switch replacements and configurations using labs like server-core-switch-lab. This allows testing of:
 - VLAN migrations
 - ACL deployment
 - Firmware upgrades
 - Rollback procedures
