

What types of optical amplifiers are available from different suppliers

Overview

The most common types are fiber amplifiers (such as the EDFA) and semiconductor optical amplifiers (SOAs). They are distinct from lasers in that they typically lack a resonant cavity and thus do not generate light on their own (ideally) but amplify an external seed. Understand the Technical Background To support your technical evaluation, this section includes links to authoritative encyclopedia articles for in-depth verification of the underlying physics, technical issues and techniques. While EDFAs dominate the C/ L bands (~1530–1600 nm) and Raman amplifiers enhance long-haul performance, other amplifier types extend coverage and functionality. Use the filters to narrow down on products based on your requirement. PDFFA (Praseodymium Doped): Operates in the 1300nm band. SOA's work in a broader range, from 400-2000nm.

Optical Amplifiers – optical amplification

Ultrafast Amplifiers Gain Saturation Detrimental Effects of High Gain Amplifier Noise Generally, amplifiers do not only amplify any intensity or phase noise of the input, but also add some excess noise. This applies not only to laser amplifiers, where excess noise can partly be explained as the effect of spontaneous emission, but also to nonlinear amplifiers. The noise figure e.g. of a fiber amplifier is a measure for how much excess... See more on [rp-photonics Optic.ca](https://www.rp-photonics.com/Optic.ca)
