

Will the optical module be recognized if A and B are reversed

Overview

It's a fairly simple solution; unplug the LC couplers on the TAPs' network ports A and B and reverse the polarity, only at the end connected to the TAP. 0 Standard (Commercial Building Telecommunications Cabling Standard) defines the A-B polarity scenario for discrete duplex patch cords, with the premise that transmit (Tx) should always go to receive (Rx) — or "B" should always connect to "A" — no matter how many segments there are. MPO polarity refers to the correct alignment between the transmit (Tx) and receive (Rx) channels for optical signals. So in a nutshell, if the devices connected to the TAPs'. The three methods defined by the TIA 568 standard to ensure the correct polarity of optical fibers are named Method A, Method B, and Method C. A-A (Straight Through) Polarity: Less common configuration where Tx connects to Tx and Rx connects to Rx on both ends.
