

Working principle of wireless optical modules in the UAE

Overview

OWC wirelessly transmits data using light waves across the infrared (IR), visible, and ultraviolet (UV) spectra. The system modulates the light signals, which then traverse through free space to reach the receiver, which demodulates them. Operating at the physical layer of the OSI model, optical modules are core devices in optical fiber communication systems. They mainly consist of optoelectronic components (such as optical transmitters and receivers), functional circuits, and optical interfaces, aiming to achieve the. Optical wireless systems support various topologies, including point-to-point, point-to-multipoint, and ring bus configurations.
